

PRESETS AND LINE ITEM VARIABLES

Builder3D uses both preset and line item variables.

Presets are universal variables you can apply regardless of the catalog defaults, and they will override those catalog defaults. They are entered prior to the individual line items and will apply to all of the individual cabinets entered later.

Not all presets are available all times, depending on the settings of prior presets. For example, you will not see drawer box material or construction options if you select “Box Not Included” in the Drawer Box Options.

Variables can also be set for **individual cabinets/line-item entries**. Click on the configurator/ editor **blue** symbol just to the right of the Price displayed for each line item. You will be taken to a 3D rotatable display of the cabinet and an opportunity to set any of the variables, if available, for this item alone. Saving the changes will calculate the new price for the item and *will override any conflicting universal Preset defaults for that unit.*

BE AWARE Preset variables can be set after individual line items are entered, but those Presets will be applied universally and *will overwrite any conflicting individual line-item variables entered earlier. The variable set last will overwrite the same variable set earlier.*

While altering them is a good way to try out different case materials, etc., CabParts strongly suggests giving them careful consideration before entering your final order line items.

Presets (PS) & Line Item Variables	
1	Case material Type (PS)
2	Case material
3	Case front EB material type (PS)
4	Case front EB material
5	Shelf edgeband material type (PS)
